

Authentic Intelligence

2026, robots, AI and new things to fear,

But what about our future careers?

This new technology has become so advanced,

It's almost like the future of our generation has no chance.

To become future lawyers, doctors, and engineers,

Will there be a use for humans? Who knows, but AI we do fear.

150 years ago, jobs existed like being a sharecropper, a farmhand, a planter, and a sugar cane chopper.

Until 100 years ago, the roaring 2020s gave us opportunities to work in a factory or obtain trades like carpentry and brick masonry.

50 years ago, sharecropping became a thing of the past and farming equipment were replacing humans...and fast.

Then came another shift in careers,

Increasing the numbers of electricians and engineers.

Today, computer programmers and their intelligence have grown,

From dial up desktops to having the World-Wide web in the palm of our hands labeled smartphones.

AI is said to be our replacements and that sounds critical,

But, as always, our careers will evolve because our intelligence isn't artificial.
